12/4

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

## Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

## Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

## NON-WOVEN ABRASIVE MATERIAL

Field of the Invention

This invention relates to non-woven abrasive materials.

Background to the Invention

Non-woven abrasive materials are well known in the art. Many of these articles are manufactured from polyamide fibres (such as Nylon 6 or Nylon 66), and include a binder such as phenol-formaldehyde (PF) resin.

Most known abrasive products have sufficient integrity (defined by the tear strength of the material) that they retain a "sheet" type structure. That is, they have defined surfaces that may remain in the sheet shape when in use, such as for surface finishing and cleaning. Products that do not have such integrity tend to be too coarse (e.g. wire wool) or too soft (such as cotton wool). Other products may be solid (such as a pumice or sandpaper).

Summary of the Invention

According to a first aspect of the present invention, an abrasive material comprises non-woven, synthetic fibres, and can be separated in user-defined quantities.

According to a second aspect of the present invention, an abrasive material comprises non-woven, synthetic fibres, does not have a planar surface.

According to a third aspect of the present invention, an abrasive material comprises non-woven, synthetic fibres, and has substantially the same tear strength in all directions.

According to a fourth aspect of the present invention, an abrasive material comprises non-woven, synthetic fibres, and is disclosed, wherein the material is not needed.

According to the present invention, an abrasive material has a low enough strength to allow it to be separated into the desired quantity, and a high enough strength to maintain a wad of material as such, when in use.

Description of the Invention

The novel non-woven abrasive material of the present invention may be manufactured from components typically found in conventional non-woven materials. For example, it may be made from Nylon 66, in combination with PF resin, or from polyester with acrylic binder.

The novel material has a number of physical characteristics and properties that differ from known materials.

In particular, the material can be torn apart, as wads, and also shaped, or "crumpled", into a desired form. After such shaping, the product does not have a planer surface and, unlike conventional products, cannot easily be converted back into its previous form.

The ease with which the material may be torn apart and, in particular, that there is no "directional influence" on the tearing, means that the material may be separated in user-defined quantities. By "no directional influence" is meant that there is no difference in the force required to tear one part of the product from that required to tear any other part. This is a significant improvement, as conventional materials are provided in manufacturer-defined quantities.

The desired properties may be achieved as a result of the manufacturing process. Accordingly, a novel process for the production of a non-woven, synthetic, abrasive material comprises the steps of:

- (i) separating and blending fibres;
- (ii) carding and cross-laying the fibres to form a fleece;
- (iii) spraying the resulting fleece with a slurry containing abrasive grain and binder; and
- (iv) drying and curing the binder in an oven.

It will be obvious to one skilled in the art that alternative methods of preparing non-woven abrasive materials are known. For example, air-laying may be used, instead of carding.

The following examples illustrate the invention. A light-weight abrasive (LWA) is constructed from three elements, using the above-described process. In particular, fibres have been used having a fibre weight of between 20 and 70 g/m<sup>2</sup> binders have been used with a binder weight of between 20 and 40 g/m<sup>2</sup>, and abrasive grains have been used having a weight of between 15 and 60 g/m<sup>2</sup>.

More particularly, the fibres are PA66 and polyester. It is understood that any synthetic staple fibre may be used, dependent upon the desired use of the product and the binder system employed. 17 denier fibre is used. It is understood that fibre deniers of between 5 and 200, or combinations thereof, may be used, dependent upon process and also product performance requirements. The fibres used have

staple lengths of about 60 mm. It is understood this may vary, dependent on product performance and process requirements.

The binders used are aqueous phenolic resin, in combination with PA66 fibres, and acrylic binders in combination with polyester fibres. Again, dependent upon product application and process requirements, any binder system may be employed, for example, epoxy's-SBR or polyurethane.

The abrasive grains used are aluminium oxide and fused alumina silicate. It is understood that other abrasives, such as silicon carbide, may be used, dependent upon the desired performance characteristics of the product. The size of the abrasive grain used is 180 and 320 grit. It is understood that any size, or combination thereof, of grains between 36 and 1800 grit may be used. Combinations of components are summarised in Table 1.

Table 1

Fibre type/denier/length	Fibre wt. (g/m <sup>2</sup> )	Spray wt. (g/m <sup>2</sup> )	Grit type/size	Grit wt. (g/m <sup>2</sup> )	Binder
PA 66 17 dtx/ 60mm	70	20	Fused Alumina Silicate/ 320	15	PF
	60	25		19	
	50	30		23	
	40	40		30	
	30	60		45	
		80		60	
Polyester s 17 dtx/ 63mm	30 20	60 20	Fused Alumina Silicate/ 320 & 180	50	Acrylic
PA66* 17 dtx/ 60mm	30	30 80	Fused Alumina Oxide 320	22 60	PF

LWA's of the present invention may have significantly lower tensile strengths and fleeced and finished weights, as shown in Table 2.

Table 2

	Tensile strength (length) (N/50 mm)	Tensile strength (length) (N/50 mm)	Tear strength (N)	Fleece weight (g.m <sup>-2</sup> )	Finished weight (g.m <sup>-2</sup> )
LWA	5.5	4	1.7	30	70
Freudenberg 4639	30	60	12	70	330

5

10

Materials of the present invention are useful in a number of applications, for example, where a deformable abrasive material is required. They also allow for alternative methods of delivery to a user, such as pinch extraction from a box or sleeve. In this way, the user may control the quantity of material dispensed for each application.

CLAIMS

1. An abrasive material comprising non-woven, synthetic fibres, which can be separated in user-defined quantities.
2. An abrasive material comprising non-woven, synthetic fibres, which does not have a planar surface.
3. ~~An abrasive material comprising non-woven, synthetic fibres, which has substantially the same tear strength in all directions.~~
4. An abrasive material comprising non-woven, synthetic fibres, which is not needed.
5. An abrasive material according to any preceding claim, wherein the abrasive is in the form of grains which are held in the material by a resin or other binder.
6. A method of abrading a surface, which comprises contacting the surface with a wad of an abrasive material according to any preceding claim, wherein the wad is obtainable from a larger mass of the material having a sufficiently low strength to allow it to be separated into the wad, of a desired quantity, and a sufficiently high strength to maintain the wad of material when in use.
